

Community-Based Weekly Grocery App - Feature Summary & Procurement Management

This document summarizes the recommended MVP (Minimum Viable Product) features for a gated-community weekly grocery aggregation platform. The business model is based on collecting weekly orders, aggregating demand, procuring in bulk from Kadapa, transporting to Hyderabad, and delivering on weekends.

1. Business Workflow

- Monday: Weekly ordering opens
- Wednesday Afternoon: Ordering closes
- Wednesday Evening: Procurement planning
- Thursday-Friday: Procurement and transportation
- Saturday-Sunday: Community delivery

2. Customer App Features

- Phone number login with OTP
- Home screen with weekly countdown timer
- Product categories and search
- Cart with weekly delivery slot selection
- Saturday/Sunday delivery selection
- Order tracking using weekly progress stages
- Push notifications and in-app notifications
- Order history and repeat order option
- Community announcements and offers
- Referral system for inviting neighbors

3. Weekly Tracking Flow

- Order received
- Aggregated with community orders
- Procurement in progress
- Transport to Hyderabad
- Packing in progress
- Out for weekend delivery
- Delivered

4. Admin / Owner Features

- Weekly dashboard with order statistics

- Product management and weekly availability
- Weekly ordering open/close control
- Aggregated procurement view
- Customer-wise order list for packing
- Export procurement sheets to Excel/PDF
- Delivery batch management
- Basic analytics and sales reports

5. Marketing Features

- Referral rewards system
- Community announcements
- Weekly special offers
- Countdown urgency banners
- Bulk discount promotions
- Community ambassador strategy
- Push notifications for engagement

6. Procurement Management (Detailed Explanation)

Procurement management is the core operational system of your business model. Instead of maintaining a large warehouse with live inventory, the platform first collects customer orders for the week and then calculates the total quantity required. Example: If 100 families order: - Tomatoes = 240kg - Onion = 180kg - Rice Bags = 42 The system aggregates these quantities automatically and generates a procurement sheet. The owner then purchases the required quantities in bulk from Kadapa suppliers. Main procurement management features include: 1. Aggregated Product Summary Automatically calculate total required quantity for every product. 2. Procurement Dashboard Show all required items in one place for bulk purchasing. 3. Vendor Planning Track which supplier or market will provide each product. 4. Procurement Export Generate Excel or PDF sheets for easy purchasing and logistics coordination. 5. Transport Tracking Mark stages such as: - Procurement started - Goods loaded - Transport in progress - Arrived in Hyderabad 6. Packing Assistance Convert aggregated products back into customer-wise packing lists. 7. Waste Reduction Since products are bought only after orders are collected, wastage and unsold inventory are minimized. 8. Profit Optimization Bulk procurement improves negotiation power and reduces per-unit cost.

Feature	Purpose
Weekly Aggregation	Combine all customer demand
Procurement Sheet	Help bulk purchasing
Packing Lists	Prepare customer deliveries
Delivery Batching	Optimize weekend deliveries
Notifications	Keep customers informed

Recommended MVP Strategy: Start with one gated community, one weekly ordering cycle, push notifications, COD/UPI payments, and a simple admin dashboard. Focus on operational efficiency and community trust before expanding.
